In recent years, we have witnessed an explosion in the number of online scientific journals. Facilitated by the relative ease of online publishing and the growing power of online publishing houses, thousands of new open-access journals have appeared. Often filling niche topics, these new journals have progressively descriptive (or catchy) titles. Perhaps the ultra-specialization of journals isn’t a bad thing: The efficiency of searching on pubmed or google scholar is making the classic model of scientific journal consumption obsolete. Journals on obscure subjects are no longer dependent on circulation and references, and can now simply allow readers to arrive at their doorstep after search engine keyword searches. The era of efficiency seems upon us.

Unfortunately, many new online journals represent nothing more than a scam.1 They aggressively send out mass solicitations via email for article submissions, and sometimes editorial positions. They promise “rapid turnaround times” and provide hints that submissions will get easy reviews. The peer-review process becomes a formality on the way to the press. They frequently hide their publication fees, but authors are later asked to pay hundreds or thousands of dollars per article. They are rarely indexed by pubmed, or cited by others. Many simply vanish if they prove unprofitable. By participating in this scheme, these predatory journals,2 and the authors who choose them, have contributed to an adulteration of the scientific publishing, driven by monetization as well as the competitive culture of academia. One way to combat these predatory journals is for field leaders to compile “green lists” of reputable journals.3 Although helpful, this does not completely remove the incentive for many authors to submit.

The primary aim of the New York Journal of Surgery is to be a different kind of online open-access journal. You will not see us in your inboxes on Monday mornings urging you to Submit Now! We will not panhandle for editorial board members. Our editorial team and panel of reviewers will be academic surgeons, physicians, and scientists, who wish to volunteer their time and expertise to the New York Journal of Surgery. Our primary academic affiliation is with New York Medical College at Metropolitan Hospital Center: a public hospital-based surgical department in the East Harlem neighborhood of New York City, along with various academic affiliates in the New York area and abroad. Submitting and publishing your article is—and always will be—completely free of cost. In this way, we will adhere to strict peer-review and editorial standards of academic publishing. Ultimately we will let the Authors’ contributions speak for themselves. Isn’t this what the dialogue of science, at its core, should be?

The secondary aim of this journal will be to provide a venue to publish case reports and academic discussions relating to current areas of debate in Surgery. It has become increasingly difficult to publish surgical cases in the literature, owing to limited space-per-issue in established journals, intense
competition among submissions, and the observational nature of case reports. As a result, only "exotic" cases are published in the literature, and many interesting cases that offer practical contexts for discussing current topics in surgery never see the light of day. Authors instead present these cases at association meetings, where discussion with peers is brief, and there is no guarantee of permanence. To start, the NYJS will not place a cap on the number of case reports published per issue, and it will not exclusively publish the rarest cases. Instead, the criteria for publication will be based on whether the discussion adds perspective to the current debate on the topic at hand. The focus will be broad: Submissions from all surgical subspecialties and related topics will be welcome for peer-review.
